//gs I/O Soft Switches	2
Improved & Safer Text I/O Speedup for DOS 3.3.	8
Monitor CTRL-Y Command in the //gs	12
How to Use the USR Command in S-C Macro Assembler.	18
Little Bugs in ProDOS /RAM	22
New Features in Apple //gs Monitor	23
New ProDOS Version of S-C XREF	29

Jerry Lewis (not the entertainer), a subscriber from New Boston, Michigan, recently worked with Phil Wershba at SCRG to modify chip 0 on the QuikLoader card. The result is the ability to include ProDOS in chip 0. If you already have a QuikLoader, Phil says upgrades are available (there is a small fee this time). Call Phil at 1-800-635-8310. If you do not have a QuikLoader yet, and want one, you can order from us (we will even save you a few dollars!).

Jim Davis (not the cartoonist), a subscriber in Upland, California, has a business that may be of interest to a lot of you. He will buy broken computers, especially Apple II and IIPlus models. He will also do chip-level repair of computers, power supplies, and 5.25" disk drives. If you have a II or IIPlus that will not quite work with a 65C02, and you wish it would, he will modify the motherboard for you so that it works. I haven't tried out his services yet, but if it sounds interesting call him at (714) 982-0860. Or write to him at Beehive Enterprises, 1476 N. Grove Ave., Upland, CA 91786.

//gs I/O Soft Switches.....Bob Sander-Cederlof

In spite of the ton of documentation Apple has made available to developers about the //gs, there is a lot of nitty-gritty detail that we need and have not got. Or at least it is very difficult to find the important, weed out the inaccurate, sift through the mutually contradictory, and so on.

I have been trying to get a complete and accurate map of the I/O addresses in the \$C000-\$C07F range, and I think I am getting close. Here is a summary of what I have learned.

The following addresses have exactly the same function in the //e and the //gs:

\$C000 - \$C01F	Keyboard & Memory mapping
\$C030	Speaker Toggle
\$C050 - \$C05F	Graphics modes & Gameport ANx
\$C061 - \$C067	Gameport buttons & Paddles
\$C070	Paddle Trigger
\$C080 - \$C08F	Language card control

The following //e addresses have no function in the //gs, but are reserved for future expansion:

\$C020	was cassette output toggle
\$C040	was gameport utility strobe

The address \$C060 was used for cassette input in //e, II+, and II systems. In the //gs some sources say \$C060 is used for a fourth gameport switch input, called switch 3 (I cannot find such a signal on any gameport pin in my //gs). \$C061 through \$C063 are still called switches 0, 1, and 2. \$C061 is still attached to the Open-Apple key, and \$C062 to the Solid-Apple.

\$C071-\$C07F is used by the //gs for ROM-based code, rather than soft switches. This range of memory is always available, so interrupts vector here.

C071: E2 40	SEP #\$40	SET V-BIT
C073: 50	(BVC OPCODE, SKIPS NEXT BYTE)	
C074: B8	CLV	CLR V-BIT
C075: 5C 10 00 E1	JMP \$E10010	
C079: 38	SEC	
C07A: 90	(BCC OPCODE, SKIPS NEXT BYTE)	
C07B: 18	CLC	
C07C: 5C 5B B6 FF	JMP \$FFB65B	

Address \$C021 controls the NTSC video output. Store \$80 to kill color output, or \$00 to enable color. This has no effect on the RGB output.

Address \$C022 controls the RGB video output text and background color. The high four bits determine the text (foreground) color, and the low four bits determine the background color. The border color is controlled by the low four bits of \$C034. In all of these, the color code is the same as lo-res graphics.

S-C Macro Assembler Version 2.0.....DOS \$100, ProDOS \$100, both for \$120
 Version 2.0 DOS Upgrade Kit for 1.0/1.1/1.2 owners.....\$20
 ProDOS Upgrade Kit for Version 2.0 DOS owners.....\$30
 Source Code of S-C Macro 2.0 (DOS only).....additional \$100
 Full Screen Editor for S-C Macro (with complete source code).....\$49
 S-C Cross Reference Utility.....without source code \$20, with source \$50
 RAK-Ware DISASM.....without source code \$30, with source \$50
 S-C Word Processor (with complete source code).....\$50
 DPl8 Source and Object.....\$50
 Double Precision Floating Point for Applesoft (with source code).....\$50
 ES-CAPE (Extended S-C Applesoft Program Editor).....

Including Version 2.0 With Source Code.....\$50
 ES-CAPE Version 2.0 and Source Code Update (for Registered Owners)....\$30
 Bag of Tricks 2 (Quality Software).....(\$49.95) \$45 *
 MacASM -- Macro Assembler for Macintosh (Mainstay).....(\$150.00) \$100 *
 S-C Documentor (complete commented source code of Applesoft ROMs).....\$50
 Cross Assemblers for owners of S-C Macro Assembler.....\$32.50 to \$50 each
 (Available: 6800/1/2, 6301, 6805, 6809, 68000, Z-80, Z-8, 8048,
 8051, 8085, 1802/4/5, PDP-11, G1650/70, others)

AAL Quarterly Disks.....each \$15, or any four for \$45
 Each disk contains the source code from three issues of AAL:

Jan-Mar, Apr-Jun, Jul-Sep, and Oct-Dec.

(All source code is formatted for S-C Macro Assembler. Other assemblers require some effort to convert file type and edit directives.)

Diskettes (with hub rings)..... package of 25 for \$15 *
 Vinyl disk pages, 6"x8.5", hold two disks each.....10 for \$6 *
 Diskette Mailing Protectors (hold 1 or 2 disks).....40 cents each
 (Cardboard folders designed to fit 6"x9" Envelopes.) or \$25 per 100 *
 Envelopes for Diskette Mailers..... 6 cents each

65802 Microprocessor (Western Design Center).....(\$95) \$50 *
 quikLoader EPROM System (SCRG).....(\$179) \$170 *
 PROMGRAMMER (SCRG).....(\$149.50) \$140 *
 Minuteman 250 Uninterruptible Power Supply.....(\$359) \$320 +

\$C023 = VGC interrupt status and enable byte.

\$C024 = Mouse data byte

\$C025 = Keyboard data register
 bit 7 = Open-Apple
 bit 6 = Solid-Apple
 bit 5 = flags this data updated
 without a keypress
 bit 4 = numeric keypad key depressed
 bit 3 = repeat active
 bit 2 = caps lock down
 bit 1 = control key down
 bit 0 = shift key down

\$C026 = data register for talking to 50740 chip

\$C027 = keyboard and mouse status byte

\$C028 = ROM bank toggle. In the normal state with LCROM and I/O shadowing on addresses \$D000-FFFF map directly into the same locations in bank \$FF. After one LDA \$C028, \$D000-FFFF access \$9000-BFFF in bank \$FF. State of the toggle may be read in \$C068 (state register) bit 1.

\$C029 = control for new video states.
 bit 7 = enable super hi-res
 bit 6 = enable linear addressing for hi-res
 bit 5 = force monochrome in super hi-res
 bit 0 = enable bank 1 latch
 Whatever you do to the data in this byte, be sure you do not change bit 0. First read the byte, then change bits 5,6,7 as you like, then store the byte.

\$C02A = reserved

\$C02B = foreign language selection
 bits 765 = 0 for USA English
 = 1 for UK English
 = 2 for French
 = 3 for Danish
 = 4 for Spanish
 = 5 for Italian
 = 6 for German
 = 7 for Swedish
 bit 4 = 0 for NTSC, = 1 for PAL
 bit 3 = 1 for above languages, = 0 for USA
 The ASCII codes which change are \$23, 40, 5B, 5C, 5D, 60, 7B, 7C, 7D, and 7E.

\$C02C = Address for test mode read of character ROM

\$C02D = slot ROM enables, where bit x controls slot x.
 (do not enable slot 0 or 3!)

\$C02E = vertical video address / 2

\$C02F = horizontal video address in bits 6-0
 lsb of vertical address in bit 7
 In NTSC mode, the vertical address runs from \$0FA
 through \$1FF, for 262 lines. The horizontal address
 runs from 40 through 7F, and 00 (65 different values)

\$C031 = 3.5" disk drive control
 bit 7 = head select
 bit 6 = drive enable

\$C032 = Clear Scan interrupt
 bit 6 = 0 to clear 1 second interrupt
 bit 5 = 0 to clear scanline interrupt

\$C033 = clock chip data register

\$C034 = clock chip control register & border color
 bit 7 = 1 to strobe data into clock
 = 0 when data has been accepted
 bit 6 = 1 to read chip, =0 to write chip
 bit 5 = chip enable after transfer
 bits 3-0 = border color

\$C035 = shadow control register
 bit 6 = 0 to shadow I/O and "Language card". When IOLC
 shadowing is on, the RAM at \$C000-CFFF is
 folded into a second bank at \$D000-DFFF,
 making a "language card".
 bit 4 = 0 to shadow aux hi-res page (used with bits 1
 and 2 to inhibit shadowing in bank \$01)
 bit 3 = 0 to shadow 32K video buffer (\$2000-9FFF in
 bank \$00)
 bit 2 = 0 to shadow hi-res page 2 (\$4000-5FFF in banks
 \$00 and \$01)
 bit 1 = 0 to shadow hi-res page 1 (\$2000-3FFF in banks
 \$00 and \$01)
 bit 0 = 0 to shadow text pages (\$400-7FF in both banks
 \$00 and \$01. Text page 2, \$800-BFF, is never
 shadowed.)
 RESET clears this register, enabling all shadowing.

\$C036 = speed control and disk motor on detection
 bit 7 = 0 for slow speed
 bit 4 = 0 (if you make it =1, it will stop you cold! I
 got FATAL SYSTEM ERROR 0681. Supposedly it
 causes shadowing in ALL banks!)
 bits 3-0 = motor on detection bits for slots 7-4. For
 example, if bit 2 is on, the system will slow
 down to 1MHz operation when the address \$C0E9
 (slot 6 motor-on command) is detected. The
 system will speed up again when \$C0E8 (slot 6
 motor-off) is detected, unless bit 7 = 0.

\$C037 = DMA bank address register

\$C038 = SCC channel B command register
 \$C039 = SCC channel A command register
 \$C03A = SCC channel B data register

7 Meg Iie/1 Meg Iic

Want the best & easiest-to-use (most support) RAM card on the market — at the best price? Buy Checkmate Technology's **State-of-the-Art MULTIRAM RGB RAM CARD™** from us w/**BATTERY BACKED-UP RAM** options that **save programs like AppleWorks for 10+ years!** FAST CHEAP REPLACEMENT FOR HARD DISKS, USER EXPANDABLE TO 7 MEGABYTES, compatible with all (100%) 3rd party software/hardware, optional 65C816 Co-Processor card (\$147), sharp 80 columns/Double Hi-Res, & FREE RGB*! It's a direct substitute for Ramworks I-III™ by Applied Engineering (also known as Preferred Computing) or Apple 80 col cards, has a **5 YR WARRANTY, 15 day money back guarantee, & FREE AUTOMATIC SOFTWARE UPDATES ONLY FROM US!**

MultiRam RGB expands to 1 Meg RAM + optional 4 Meg's **MultiRam Plus BATTERY PROTECTED RAM**. Optional 2 Meg's **STATIC RAM** here soon — for a total of 7 megabytes! **MultiRam Iie** expands to 768k. And the software & manual is the best on the market!

FREE APPLEWORKS EXPANDER SOFTWARE WITH EVERY CARD — loads ALL versions of Appleworks (in 30 seconds w/AW 2.0), even printer routines, runs faster, expands Desktop over 2048k, stores 23,000+ records & 4,800+ word processor lines, auto-segments large files onto multiple disks! **FREE AW TIME/DAY/DATE ON-SCREEN w/ clock, AUTO-COPY TO RAM, PRODOS/DOS 3.3. RAM DISK & RAM TEST.** Optional CP/M & Pascal Ram disks (\$20/ea)!

I have been trying to piece together a lot of DOS 3.3 improvements published in back issues of Apple Assembly Line, and I especially wanted to fit the Text File I/O improvements made by Paul Schlyter. (See AAL July 1983: "Speeding Up Text File I/O", by Paul Schlyter; and "Making Paul's Patches Fit in DOS", by Bob Sander-Cederlof.) Bob has said in several phone conversations that he continues to have reservations about using this patch, because of the possibility of DOS becoming confused over the state of the File Manager Workarea. He even suggesting using the space for some other improvements.

Why didn't I follow his advice? I guess the idea of a faster way of handling TEXT files is so attractive that I keep thinking the approach can be made to work. I made some small changes to the 1983 patches, and I believe they are now safe. Bob's last-minute warning on page 17 of the 1983 article still holds, however: do not try to install the patch from inside an EXEC file. You should not patch a piece of code while it is being used! The code as it is here can be BRUN from within a small HELLO program with no trouble.

The boxed comment on page 16 of the 1983 article, about patching \$A1B1 to \$14, was interesting. This value determines how many locations will be cleared to zero by the loop starting at \$A1AE. The loop as coded in DOS clears too many bytes, so Bob's patch fixes it. Then he can use those bytes at the end for a variable of his own. Another loop at \$ABDC also clears out the location Bob wanted to use, but it did not interfere with Bob's use. I chose to avoid the problem by using a different location for my PNTR.SAVE variable: \$B5FE,B5FF. This is still close enough to \$B5C7 (start of FM workarea) to use the indexing trick (at lines 1740,1750 in my program).

I saved the one extra byte Bob mentioned on page 15 of his article, by avoiding the SEC in the CHECK.OPCODE subroutine. I changed the origin of the patch from \$B6B3 to \$B6B4, to give one more byte to another set of patches I am using.

Bob's main reservation about using the speedup was the danger of FLAG being set without a valid address in PNTR.SAVE. I avoid this by not setting FLAG until after placing a valid address in the pointer (lines 1820-1840), and by clearing FLAG before using the pointer to save the workarea (lines 1730-1760).

FLAG is cleared by all FM commands other than Read and Write, including INIT, so there is no way an initialized disk will have the sign bit of FLAG set. If you follow all abnormal exits from handling text files with the CLOSE command, that will clear FLAG in those cases; it was good policy to do this even before these patches. [Maybe we should find all those abnormal exits, and make them specifically clear FLAG...]

I hope you like my version and agree that the enhancement can be safely used. All my tests, so far, indicate it is safe.

Serial Pro® The intelligent multifunction card from Applied Engineering.

Serial Pro is a powerful multifunction card for the Apple IIe, II+, IIcs and compatible computers. Serial Pro combines a powerful serial port for interfacing to a printer, modem or other serial device, with a full function clock/calendar. Serial Pro's serial port is compatible with virtually all letter quality and dot matrix printers, including Apple's Imagewriter and Imagewriter II, and can communicate with the fastest external modems at baud rates from 50 to 19,200.

Set up is easy, because unlike other cards, there are no switches to program serial parameters or disks to use. Serial Pro has a built-in setup screen that allows all parameters to be set. And on-screen help that makes it super-easy. An on-board battery stores your selections for over 20 years, but you can change them at any time. Serial Pro is the perfect upgrade for Super Serial card owners looking for more performance or a built-in clock.

Serial Port Features

- Fully Super Serial Card compatible but more versatile and easier to use
- Compatible with printers
- Compatible with modems
- Prints graphics to printer (without software) in normal mode, 90° rotation, double size, side by side, and black/white inversion
- Variable word length, number of stop bits and parity selection
- Crystal controlled circuits are used to provide ultra accurate baud rates

Clock Calendar Features

- ProDos, DOS and AppleWorks compatible. Displays time and date on the AppleWorks screen
- Automatically time and date stamps AppleWorks files
- 20 year auto recharging nickel-cadmium battery
- Realtime interrupts
- Built-in on screen time and date settings (no software needed)
- Does not use phantom slots

Serial Pro is perfect for Apple IIe, II+, IIcs or compatible owners in need of a serial port or clock/calendar or both. But unlike other multifunction cards on the market, Serial Pro does not use phantom slots, so all the slots in your computer are useable.

Serial Pro comes complete with manual, cable and instructions for connecting to all the leading printers and modems. Serial Pro **\$159**

Order Today! See your dealer or call Applied Engineering, 9 a.m. to 11 p.m. 7 days. Or send check or money order to Applied Engineering, MasterCard, VISA and C.O.D. welcome. Texas residents add 5% sales tax. Add \$10.00 outside U.S.A.

AE APPLIED ENGINEERING™

The Apple enhancement experts

(214) 241-6060

P.O. Box 798, Carrollton, TX 75006

With the Z-80 Plus®, run over 5000 new CP/M® programs.

*Now, get two computers
in one, and all the
advantages of both.*

Enter the CP/M world with the new Z-80 Plus card from Applied Engineering, and introduce your Apple IIe, IIcs or II+ to thousands of CP/M programs. Only the Z-80 Plus comes standard with the new 5.1 software, the most advanced system ever for running CP/M programs.

The new 5.1 boasts advanced features like built-in disk emulation for popular memory expansion boards, boosting both system speed and storage capacity. And menu-driven utilities that let you get to work faster. The Z-80 Plus also lets you run older CP/M programs—all the way down to Version 1.6 (2.2 is the most popular).

The Z-80 Plus is the only card on the market capable of accessing more than 64K. If you have an extended 80-column card, all 128K is usable. And if you have RamWorks, RamFactor, sRam, sRam Plus, or an Apple memory card in your IIe, IIcs or II+, up to 1088K is available.

Each Z-80 Plus comes with our CP/M Ram Drive software, enabling most memory cards to work as a high-speed Ram disk so CP/M software can run up to *twenty times faster*. So packages like WordStar, dBASE II, Turbo Pascal and most others run at blinding speed.

Simply plug the Z-80 Plus into any slot in your Apple. You'll get the benefits of two computers in one—all at an unbelievably low price (only \$149!).

- Fully compatible with ALL CP/M software
- Fully compatible with 5¼" and 3½" disk drives as well as most hard disks including the Sider
- Fully compatible with Microsoft disks (no pre-boot required)
- Specifically designed for high speed operation
- Runs WordStar, dBASE II, Turbo Pascal, and ALL other CP/M software with *no pre-boot*
- Semi-custom I.C. and low parts count allows Z-80 Plus to fly through CP/M programs with extremely low power consumption (we use the Z-80B)
- Does EVERYTHING other Z-80 boards do, *plus* Z-80 interrupts
- Five-year warranty

To get your Z-80 Plus or for more information see your dealer, or call 214 241-6060 9 a.m. to 11 p.m. seven days, or send check or money order to Applied Engineering, MasterCard, VISA and C.O.D. welcome. Texas residents add 5% sales tax. Add \$10.00 outside U.S.A.

The Monitor ctrl-Y Command in the //gs....Bob Sander-Cederlof

The Apple monitor has always had a control-Y command, called the "user" command. It allows you to add at least one command to the monitor on a temporary basis. The older versions merely JMPed to \$03F8, but the //gs does a little more.

If you ran my program from last month's AAL, which printed out the addresses in the //gs monitor command table for each command, you found out that the ctrl-Y command starts at \$FE13. To see what that is, enter the monitor L command as follows:

*FF/FE13L

The code in my //gs is CLC, XCE, and JMP \$E100A0. The instruction installed at \$E100A0 when you turn on the //gs is JMP \$FFFE19, and the code at FFFE19 is SEC, XCE, and JMP \$03F8. So we end up at \$3F8 after all!

If you want to, you can ignore the new stuff and just use ctrl-Y like you did in the old days. Or, you can put a 3-byte address for a Native mode program into the JMP instruction at \$E100A0.

I wrote a program to link into the \$E100A0 vector and print out the registers, the mode, and the M and X status bits. I wanted to see for certain in what state the monitor called my ctrl-Y code.

Lines 1080-1150 install the address of my ctrl-Y code in the bank \$E1 vector.

Lines 1180-1240 save the mode and the three main registers. Lines 1180-1210 on entry operate together with lines 1590-1610 at the exit, allowing me to run in Emulation mode regardless of the mode my caller was in. My program returns to the caller's mode and mx-state when it is finished.

Lines 1250-1350 show the A-, X-, and Y-registers as they were upon entry. I am only showing the low-byte of each of these, even though in the 65816 they have two bytes. Shame on me!

Lines 1410-1540 print either "EMULATION MODE" or "NATIVE MODE: M=1, X=1". If you write a little driver program to call MY.Y with various other combinations of M and X, you will see that MY.Y prints them as you have them.

Lines 1640-1680 print a message followed by the contents of the A-register in hexadecimal. I use it to print the contents of the three registers.

Lines 1700-1740 print "0" if the Z status bit is set upon entry; otherwise, they print a "1".

Lines 1760-1800 are just about the shortest loop for printing out an ASCII string I have come up with in my ten years of Apple programming. Strings are assembled with bit 7 high, and terminated by a 00 byte. On entry, the Y-register points to

Insist on GSRAM™ When You Buy Your IIGs™

*Expand the IIGs RAM and ROM with the GSRAM or GSRAM Plus
with ROM Pak. Available now with 256K to 8 MEG!*

GSRAM Plus™

Remember the 16K cards for the II+ and the 64K cards for the IIx? At the time, that much memory seemed like a lot. But when the owners of these memory cards came to us for more memory, many had to throw away their smaller Apple memory cards or try to sell them. Most of our customers told us that had they known about Applied Engineering's larger memory cards when they bought their Apple, they would have purchased them at the same time.

GSRAM and GSRAM Plus are available now, allowing up to 8 MEG of memory expansion. That's 8 times the memory capacity of Apple's card and just look at the benefits that only GSRAM and GSRAM Plus have over Apple's card:

- Lower cost
- Has 6 RAM banks (Apple's card has 4)
- Has memory expansion port
- Has ROM expansion port
- No configuration blocks to set
- No soldered in RAM chips
- Expandable to 8 MEG
- Expands AppleWorks internal limits
- Built-in Hi-Res self-diagnostic software
- 5 year hassle free warranty (Apple has a 90 day warranty)
- Made in USA

GSRAM for More AppleWorks Power

Only GSRAM and GSRAM Plus eliminates AppleWorks internal memory limits, increasing the maximum number of records available from 6,000 to over 25,000 and only GSRAM and GSRAM Plus increases the number of lines permitted in the word processing mode from 6,000 to over 15,000. And only GSRAM and GSRAM Plus offers a built-in printer buffer so you can continue using AppleWorks while your printer is printing. GSRAM and GSRAM Plus even expand the number of lines in the clipboard from 255 to 2047 and will auto segment large files so they can be saved on two or more disks. You can

even have Pinpoint or Macroworks and your favorite spelling checker in RAM for instant response. GSRAM and GSRAM Plus will even display the time and date right on the AppleWorks screen. Nothing comes close to enhancing AppleWorks so much.

Turn Your IIGs Into a Giant

Simply plug GSRAM into the IIGs memory expansion slot and you've got up to 8 megabytes of RAM at your fingertips—all of it instantly and automatically recognized by the IIGs. GSRAM is compatible with all IIGs software, including AppleWorks, as well as BASIC®, ProDOS, DOS 3.3, PASCAL®, "C" and CP/M®.

Grow by Bytes or Megabytes

We offer GSRAM in two configurations so you can increase your memory 256K at a time (GSRAM) or a megabyte at a time (GSRAM Plus). Both offer full compatibility, lower cost than other boards, and easy expandability. And both are extremely low in power consumption. A fully expanded GSRAM operates at only 375 ma, and GSRAM Plus at only 270 ma (even with 6 megabytes on board!)

GSRAM—for Normal Memory Requirements

GSRAM is available with 256K, 512K, 1 MEG or 1.5 MEG of memory already on board. If you don't need the full 1.5 MEG now, you can choose a GSRAM with less memory and expand it up to 1.5 MEG in the future—or upgrade to GSRAM Plus for a small charge.

Steve Wozniak, the creator
of Apple Computer

*"I recommend
Applied
Engineering
products
wholeheartedly."*

With an optional piggyback card, you can expand GSRAM even higher than 1.5 MEG! (Other cards are only expandable to 1 MEG.)

GSRAM Plus—for Growing by Leaps and Bounds

GSRAM Plus is the first Apple memory card to use 1 MEG RAM chips on the main board. It's available with 1 to 6 MEG on board. If you don't need the whole 6 MEG now, you can buy a GSRAM Plus with less memory and easily expand it in the future.

GSRAM Plus can be expanded up to 8 MEG with an optional piggyback card.

Easy Expansion

Both GSRAM and GSRAM Plus use standard RAM chips that are readily available and just plug right in. So unlike other cards, you'll find expanding your GSRAM or GSRAM Plus easy, convenient and very economical. And with our optional ROM expansion module you can even increase the IIGs's ROM space and all in just one slot.

Quality and Support of the Industry Leader

Applied Engineering is the largest supplier of Apple peripherals in the world. We invented the first large RAM cards for the Apple. With a 5-year "no-hassle" warranty and outstanding technical support, you can be sure GSRAM and GSRAM Plus will deliver the performance you're looking for—or return them within 15 days for a full refund.

GSRAM with 256K	\$189
GSRAM with 512K	\$219
GSRAM with 1 MEG	\$299
GSRAM with 1.5 MEG	\$379
GSRAM with 2-8 MEG	CALL
GSRAM Plus with 1-8 MEG	CALL

CP/M is a registered trademark of Digital Research, Inc.

the string to be printed, relative to the base address QTS. If you read AAL a lot, you have surely seen this little gem a lot.

After assembling the program with the S-C Macro Assembler, type MGO MY.Y to see the state of things when the program is called that way. Then type dollar sign, control-O, control-Y, and the RETURN key, to see the state of things when the ctrl-Y command is used. Or, go to the monitor with the MNTR command, and then just type a control-Y and RETURN. You might also try it with various configurations of hex values before the control-Y.

Navigate your way through ProDOSTM with MouseFileTM

The next generation desktop manager for the Apple® II.

MouseFile creates a MacintoshTM style desktop for managing disks, directories, programs, and files, and makes the ProDOS file structure easy-to-use and understand. No need to type pathnames. Look at these features!

- Quick access to all files and directories.
- Select and run programs.
- Copy (and paste), rename, compare, delete files and directories.
- Flexible file selection.
- Sort directories on the desktop.
- Work with or without a mouse.
- View the contents of files in ASCII or Hex.
- Copy , compare, rename, format disks.
- Diagnose disks for bad blocks.
- Show space used and free on disks.
- And much more!

Order by sending a check for \$39.95 (MA add \$2 tax) to:

Harbor Software, Inc.
P.O. Box 872
Acton, MA 01720

MouseFile is compatible with the Apple IIc and Apple IIe (128K enhanced).

For more information call 1-617-263-1870.

 **Harbor Software, Inc.**

RamWorks® III

Patented Performance from the Recognized Leader

With battery backed RAM port, RGB port, increased memory capacity, full software compatibility and more compact design, RamWorks III is a generation ahead.

RamWorks III is the newest 3rd generation RAM card for the Apple IIe. It incorporates all of the technology and improvements that years of experience and over a hundred thousand sales have given us. By selling more memory cards than anyone else and listening to our customers, we were able to design a memory card that has the ultimate in performance, quality, compatibility and ease of use. A design so advanced it's patented. We call it RamWorks III, you'll call it awesome!

The AppleWorks Amplifier.

While RamWorks III is recognized by all memory intensive programs, NO other expansion card comes close to offering the multitude of enhancements to AppleWorks that RamWorks III does. Naturally, you'd expect RamWorks III to expand the available desktop, after all Applied Engineering was a year ahead of everyone else *including Apple* in offering more than 55K, and we still provide the largest AppleWorks desktops available. But a larger desktop is just part of the story. Look at all the AppleWorks enhancements that even Apple's own card does not provide and *only* RamWorks III does. With a 256K or larger RamWorks III, *all* of AppleWorks (including printer routines) will automatically load itself into RAM dramatically increasing speed by eliminating the time required to access the program disk drive. Switch from word processing to spreadsheet to database at the speed of light with no wear on disk drives.

Only RamWorks eliminates AppleWorks' internal memory limits, increasing the maximum number of records available from 1,350 to over 25,000. *Only* RamWorks increases the number of lines permitted in the word processing mode from 2,250 to over 15,000. And *only* RamWorks offers a built-in printer buffer, so you won't have to wait for your printer to stop before returning to AppleWorks. RamWorks even expands the clipboard. And auto segments large files so they can be saved on two or more disks. You can even have Pinpoint or MacroWorks and your favorite spelling checker in RAM for instant response.

RamWorks, nothing comes close to enhancing AppleWorks so much.

The Most Friendly, Most Compatible Card Available.

Using RamWorks III couldn't be easier because it's compatible with more off-the-shelf software than any other RAM card. Popular programs like AppleWorks, Pinpoint, Catalyst, MouseDesk, Howard-Soft, FlashCalc, Pro-File, Managing Your Money, SuperCalc 3a, and MagiCalc to name a few (and *all* hardware add on's like ProFile and Sider hard disks). RamWorks is even compatible with software written for Apple cards. But unlike other cards, RamWorks plugs into the IIe auxiliary slot providing our super sharp 80 column text (U.S. Patent #4601081) in a completely integrated system while leaving expansion slots 1 through 7 available for other peripheral cards.

RamWorks III is compatible with all

Apple IIe's, enhanced, unenhanced, American or European versions.

Highest Memory Expansion.

Applied Engineering has always offered the largest memory for the IIe and RamWorks III continues that tradition by expanding to 1 full MEG on the main card using standard RAMs, more than most will ever need (1 meg is about 500 pages of text)...but if you do ever need more than 1 MEG, RamWorks III has the widest selection of expander cards available. Additional 512K, 2 MEG, or 16 MEG cards just snap directly onto RamWorks III by plugging into the industry's only low profile (no slot 1 interference) fully decoded memory expansion connector. You can also choose non-volatile, power independent expanders allowing permanent storage for up to 20 years.

It Even Corrects Mistakes.

If you've got some other RAM card that's not being recognized by your programs, and you want RamWorks III, you're in luck. Because all you have to do is plug the memory chips from your current card into the expansion sockets on RamWorks to recapture most of your investment!

The Ultimate in RGB Color.

RGB color is an option on RamWorks and with good reason. Some others combine RGB color output with their memory cards, but that's unfair for those who don't need RGB *and* for those that do. Because if you don't need RGB

Applied Engineering doesn't make you buy it, but if you want RGB output you're in for a nice surprise because the RamWorks RGB option offers better color graphics plus a more readable 80 column text (that blows away any composite color monitor). For only \$129 it can be added to RamWorks giving you a razor sharp, vivid brilliance that most claim is the best they have ever seen. You'll also appreciate the multiple text colors (others only have green) that come standard. But the RamWorks RGB option is more than just the ultimate in color output because unlike others, it's fully compatible with all the Apple standards for RGB output control, making it more compatible with off-the-shelf software. With its FCC certified design, you can use almost any RGB monitor because only the new RamWorks RGB option provides both Apple standard and IBM standard RGB outputs (cables included). The RGB option plugs into the back of RamWorks with no slot 1 inter-

RGB Option

ference and remember you can order the RGB option with your RamWorks or add it on at a later date.

True 65C816 16 Bit Power.

RamWorks III has a built-in 65C816 CPU port for direct connection to our optional 65C816 card. The only one capable of linearly addressing more than 1 meg of memory for power applications like running the Lotus 1-2-3™ compatible program, VIP Professional. Our 65C816 card does not use another slot but replaces the 65C02 yet maintains full 8 bit compatibility.

Endorsed by the Experts.

At+ magazine said "Applied Engineering's RamWorks is a boon to those who must use large files with AppleWorks...I like the product so much that I am buying one for my own system." inCider magazine said "RamWorks is the most

Steve Wozniak, the creator of Apple Computer

"I wanted a memory card for my Apple that was fast, easy to use, and very compatible, so I bought RamWorks."

powerful auxiliary slot memory card available for your IIe, and I rate it four stars...For my money, Applied Engineering's RamWorks is king of the hill."

Apple experts everywhere are impressed by RamWorks's expandability, versatility, ease of use, and the sheer

coverage no matter where you purchase

- Built-in super sharp 80 column display. (U.S. Patent #4601081)
- Expandable to 1 MEG on main card
- Expandable to 16 meg with expander cards, with NO slot 1 interference
- Can use 64K or 256K RAMs
- Powerful linear addressing 16 bit coprocessor port
- Automatic AppleWorks expansion up to 3017K desktop
- Accelerates AppleWorks
- Built-in AppleWorks printer buffer
- The only large RAM card that's 100% compatible with all IIe software
- RamDrive™ the ultimate disk emulation software included free
- Memory is easily partitioned allowing many programs in memory at once
- Compatible, RGB option featuring ultra high resolution color graphics and multiple text colors, with cables for both Apple and IBM type monitors
- Built-in self diagnostics software
- Lowest power consumption (U.S. Patent #4601081)
- Takes only one slot (auxiliary) even when fully expanded
- Socketed and user upgradeable
- Software industry standard
- Advanced Computer Aided Design
- Used by Apple Computer, Steve Wozniak and virtually all software companies
- Displays date and time on the AppleWorks screen with any PRO-DOS compatible clock
- Much, much more!

How to Use the USR Command.....Bob Sander-Cederlof
in the DOS 3.3 \$D000 Version
of the S-C Macro Assembler

If you are running the DOS 3.3 version of my assembler in a 64K or larger Apple, and if you are not using the Laumer Research Full Screen Editor, then you have a 4K bank of RAM available for adding features. It is a little tricky to use, but I am going to show you a secret which will make it easier.

Version 2.0 of the S-C Macro Assembler has several built-in handles for user extensions: USR, PRT, Esc-U, the "." command, and the .US directive. The program below illustrates how to vector the USR directive into the alternate bank at \$D000, and how to get back.

Lines 1160-1480 are a program to install your USR code. The first section copies your code into the \$D000 bank, and the second section patches the USR vector in the S-C Macro Assembler. I put the origin at \$2000 for the installation code, because that is a free area (big enough to hold all the code which will fit at \$D000) right after loading the S-C Macro Assembler. You can either manually install it by typing "BRUN B.USR.CODE", or add that line to the EXEC file used to load the S-C Macro Assembler.

The only patch made in the S-C Macro code is to replace the JMP \$D028 which is at \$D006 with a LDA \$C08B instruction. When you type the USR command S-C will jump to \$D006, execute the LDA \$C08B, and suddenly find itself at \$D009 in the alternate bank. That is where your USR program should begin, as you can see in my program below at lines 1570-1620. I made my first instruction in the USR code be another LDA \$C08B, which write-enables the RAM. If my code used any of the \$Dxxx area for variables, I would need it to be write-enabled.

To get back to the S-C code, the USR program jumps to \$D000 (see line 1720 and lines 1510-1530). The instruction there is a LDA \$C083, which switches back to S-C's \$D000 bank and continues execution at \$D003, which is one of S-C's soft entry points.

You could use the six bytes from \$D003 through \$D008 for variables, if you wish.

You can also link into the PRT command in this same manner, putting the LDA \$C08B instruction at \$D009 in the S-C bank, and gaining control at \$D00C in the alternate bank. If you want both USR and PRT, you can do that too. Just make the instruction at \$D009 in the USR-PRT bank a JMP USR, and start the PRT code at \$D00C. The "." command can be set up the same way. The .US directive and the Esc-U keyboard function would take a little more setup, because they do not return to the soft re-entry of S-C Macro.

My code at lines 1630-1700 is purely a demonstration, to prove that the USR command really works. Use your imagination, create some really useful functions, and replace my demo with

them.

Phil Goetz has sent me the source code for a Symbolic Step/Trace/Disassembly Utility that would fit into this USR patch very nicely. In fact, he had it set up in a similar manner, and his work led me to the discovery of this technique. If all goes well, we should be able to publish his program soon.

Meanwhile, see what you can do with this new tool.

BECOME AN ASSEMBLY LANGUAGE PROGRAMMING WHIZ

You've spent a lot of time learning Apple assembly language and finally know the difference between BEQ and BCS. Now it's time to put your new-found knowledge to work. Time to throw away your Applesoft programming manual and write programs that make your Apple work like a super-charged, super-fast computer. Time to graduate from the Applesoft BASIC used by beginners, to the 6502 assembly language used by professionals.

To help make this transition, you need an experienced programmer to guide you. You need to develop a library of subroutines that make programming in assembly language as easy as programming in BASIC. You need to learn all the tricks that take experienced assembly language programmers years to acquire. Most important of all, you need the book, "*Now That You Know Apple Assembly Language: What Can You Do With It?*" because it contains all this information and more.

It shows you how, step-by-step

"*Now That You Know Apple Assembly Language: What Can You Do With It?*" will take you step-by-step through the assembly language programming experience. You'll delve into the mysteries of the 6502 stack and learn how to use it to increase the power and versatility of your programs. You'll also learn how to use the Apple's built-in routines to minimize the amount of coding you must do.

Control the output and the input

Frequently it's desirable to gain total control of the computer's output. This book shows you how to *steal control away from the Apple's normal output routines and redirect it to your own program*. Thus if you wanted, you could see the normally invisible control characters, display text on your screen as black on white instead of the normal white on black, format text sent to a printer into pages and much more.

Expand the power of your Apple by *stealing control away from the normal input routines*. Do things like adding a screen print capability, or convert part of the normal keyboard into a numeric keypad. It's even possible to produce self-modifying programs by EXECing in commands from RAM instead of from the disk drive. Think about the possibilities that offers for protecting your programs. When you want to go back to Applesoft programming, you'll be able to do it faster with the aid of Applesoft Shorthand, an assembly language program that types in one or more Applesoft commands at the press of a key, or use another program in the book to automatically count the number of lines in your Applesoft program.

With this book you'll also learn about *generating tones and how to figure out the frequency, producing sound effects, teaching your Apple to send Morse code, restoring accidentally erased Applesoft programs, adding new commands to Applesoft and running two Applesoft programs in memory together*, to name a few.

Everything is explained

Unlike other books that merely consist of a collection of programs, this one explains what's happening, where and why. You get detailed descriptions of how the programs work and detailed program listings with virtually every line of code explained. Nothing is left to chance or misinterpretation.

Order now, get 2 FREE gifts

The book costs only \$19.95 plus \$2 for shipping and handling. Order now and you'll also get a *FREE Programmer's Number Conversion System* that makes it easy to convert between binary,

hexadecimal and decimal numbers. No calculators are required. You'll convert numbers almost instantly and wonder how you ever got along without it.

As an extra bonus for prompt ordering, you'll receive a *FREE coupon worth \$5 off* the price of a disk with all the assembled programs on it or a disk that contains the source code. These disks normally sell for \$15 each. We're offering these *FREE gifts* for a limited time only, so hurry! *Order today!*

Money-back guarantee*

We're so confident that you'll find this book invaluable and want it in your library, that we're offering a 10-day, no-questions-asked, money-back guarantee. Order the book. Read it and try the programs for ten days. At the end of ten days if you don't think it's worth every penny you paid for it, just send it back in resalable condition and we'll refund your money immediately, no questions asked.

Redlig Systems, Inc., Dept. A 978

We Make Measurement And Control Easy!

12 BIT, 16 CHANNEL, PROGRAMMABLE GAIN A/D

- All new 1984 design incorporates the latest in state-of-art I.C. technologies.
- Complete 12 bit A/D converter, with an accuracy of 0.02%.
- 16 single ended channels (single ended means that your signals are measured against the Apple's GND) or 8 differential channels. Most all the signals you will measure are single ended.
- 9 software programmable full scale ranges, any of the 16 channels can have any range at any time. Under program control, you can select any of the following ranges: ± 10 volts, ± 5 V, ± 2.5 V, ± 1.0 V, ± 500 MV, ± 250 MV, ± 100 MV, ± 50 MV, or ± 25 MV.
- Very fast conversion (25 micro seconds).
- Analog input resistance greater than 1,000,000 ohms.
- Laser-trimmed scaling resistors.
- Low power consumption through the use of CMOS devices.
- The user connector has +12 and -12 volts on it so you can power your sensors.
- Only elementary programming is required to use the A/D.
- The entire system is on one standard size plug in card that fits neatly inside the Apple.
- System includes sample programs on disk.

PRICE \$319

A few applications may include the monitoring of ● flow ● temperature ● humidity ● wind speed ● wind direction ● light intensity ● pressure ● RPM ● soil moisture and many more.

A/D & D/A

A/D & D/A Features:

- Single PC card
- 8 channels A/D
- 8 channels D/A
- Superfast conversion time
- Very easy programming
- Many analog ranges
- Manual contains sample applications

A/D SPECIFICATIONS

- 0.3% accuracy
 - On-board memory
 - Fast conversion (0.78 MS per channel)
 - A/D process totally transparent to Apple (looks like memory)
 - User programmable input ranges are 0 to 10 volts, 0 to 5, -5 to +5, -2.5 to +2.5, -5 to 0, -10 to 0.
- The A/D process takes place on a continuous, channel sequencing basis. Data is automatically transferred to its proper location in the on-board RAM. No A/D converter could be easier to use.

D/A SPECIFICATIONS

- 0.3% accuracy
 - On-board memory
 - On-board output buffer amps can drive 5 MA
 - D/A process is totally transparent to the Apple (just poke the data)
 - Fast conversion (0.003 MS per channel)
 - User programmable output ranges are 0 to 5 volts and 0 to 10 volts
- The D/A section contains 8 digital to analog converters, with output buffer amplifiers and all interface logic on a single card. On-card latches are provided for each of the eight D/A converters. No D/A converter could be easier to use. The on-board amplifiers are laser-trimmed during manufacture, thereby eliminating any requirement for off-set nulling.

PRICE \$199

SIGNAL CONDITIONER

Our 8 channel signal conditioner is designed for use with both our A/D converters. This board incorporates 8 F.E.T. op-amps, which allow almost any gain or offset. For example, an input signal that varies from 2.00 to 2.15 volts or a signal that varies from 0 to 50 mV can easily be converted to 0-10V output for the A/D.

The signal conditioner's outputs are on a high quality 16 pin gold I.C. socket that matches the one on the A/D's so a simple ribbon cable connects the two. The signal conditioner can be powered by your Apple or from an external supply.

FEATURES

- 4.5" square for standard card cage and 4 mounting holes for standard mounting. The signal conditioner does not plug into the Apple, it can be located up to 1/2 mile away from the A/D.
- 22 pin 156 spacing edge card input connector (extra connectors are easily available i.e. Radio Shack).
- Large bread board area.
- Full detailed schematic included.

PRICE \$79

I/O 32

- Provides 4, 8-bit programmable I/O Ports
- Your inputs can be anything from high speed logic to simple switches
- Any of the 4 ports can be programmed as an input or an output port
- Programming is made very easy by powerful on-board firmware
- All I/O lines are TTL (0-5 volt) compatible
- The I/O 32 is your best choice for any control application

The I/O manual includes many programs for inputs and outputs.

Some applications include:

Burglar alarm, direction sensing, use with relays to turn on lights, sound buzzers, start motors, control tape recorders and printers, use with digital joystick.

PRICE \$89

Please see our other full page ad in this magazine for information on Applied Engineering's Timemaster Clock Card and other products for the Apple.

Our boards are far superior to most of the consumer electronics made today. All I.C.'s are in high quality sockets with mil-spec. components used throughout. P.C. boards are glass-epoxy with gold contacts. Made in America to be the best in the world. All products compatible with Apple II and //e.

Applied Engineering's products are fully tested with complete documentation and available for immediate delivery. All products are guaranteed with a no hassle three year warranty.

When a ProDOS device driver reads or writes a block, it is supposed to return an error code in the A-register. If there was an error, this number will be nonzero, and the Carry status bit will be set. If there was no error, the A-register is supposed to contain zero, and Carry will be clear.

The other day I was working with a program that was supposed to read and write blocks from the /RAM drive under ProDOS. My program printed the error code returned by the call, and I was getting a non-zero value in the A-register even when there was no error. I just assumed this was a trivial bug in ProDOS, and ignored it. However, I was not using the standard ProDOS /RAM driver, because I had installed the Applied Engineering driver which uses the entire RAMWORKS card for /RAM. Anyway, I just went on about my business.

A few days later the January 1987 issue of Nibble arrived at my doorstep. In a letter to the editor on page 123, from Steven Humpage, there was an explanation of the bug. The part of the device driver that resides in Main RAM is located at \$FF00. At \$FF47 is a routine named EXIT, which restores some zero-page locations, restores a vector in page 3, and returns. This code is called with either zero in A and Carry clear, or an error code in A and carry set. The routine begins with PHP, PHA and ends with PLP, PLA. WRONG! This swaps the P- and A-registers. Since the C-bit is bit 0 in the P-register, a zero (from the A-register) results in carry clear. However, the P-register contents come back in A, something like \$36. Since the only error code the /RAM driver returns is \$27, and this has bit 0 set, swapping registers leaves carry set. It also sets the V-bit, which could be unexpected. The error code in A now becomes what the status was, so we get an error code of \$35, I believe.

The same bug exists in AE Prodrive. The bug can easily be fixed, by the following sequence. I am showing it as I do it from within the S-C Macro Assembler. If you do it from within BASIC.SYSTEM, you will have to CALL-151 to get into the monitor to install the patch.

:UNLOCK PRODOS	:UNLOCK PRODRIVE
:BLOAD PRODOS,TSYS,A\$2000	:BLOAD PRODRIVE
:\$2C5F:68 28	:\$245F:68 28
:BSAVE PRODOS,TSYS,A\$2000	:BSAVE PRODRIVE
:LOCK PRODOS	:LOCK PRODRIVE

I am assuming ProDOS 1.1.1. The bug has already been fixed in version 1.2.

While we are at it, Humpage also pointed out another bug which affects both ProDOS and Prodrive. The code which ProDOS puts into pages 2 and 3 in the AuxRAM has an error. The CMP #\$0D at \$34A should be CMP #\$0E. As it is it allows writing to block 7, which is then mapped back over the top of page zero and one, clobbering things disastrously. This change write protects that block. You only need to change the PRODOS file, because Prodrive uses it also. Change \$2B4B from \$0D to \$0E.

New Features in Apple //gs Monitor.....Bob Sander-Cederlof

The //gs Monitor (that which you get by typing CALL -151 in Applesoft, not the video screen) has a lot of neat new features. There are a significant number of new commands, and new capabilities to old ones.

The first thing you need to know is that you can now use 24-bit addresses in the monitor. These are entered by typing the bank number, a slash, and the 16-bit address within the bank. The monitor remembers the last bank number entered, so you do not necessarily have to type the bank number. For example, to examine memory in the monitor ROM itself, you could type the following:

```
*FF/F800.FFFF
```

If you try that, you will notice that both hex and ASCII values are shown for each location. If you are in 40-column mode, you get eight bytes per line as in older monitors; however, in 80-column mode you now get sixteen bytes per line. This means you can easily see an entire page in both hex and ASCII on the screen at once.

Another difference in addressing involves accessing so-called "language card" RAM. In older monitors you could flip the soft switches using monitor commands, and then address the language card. Of course, if you flipped it into a mode to read from the language card RAM, you had to first be sure to make a copy of the monitor ROM in RAM. Anyway, this no longer works. Now you cannot really flip those switches, because the //gs monitor will flip them right back before the next command. Now you can address all the RAM from \$C000 to \$FFFF in any bank directly.

If you have I/O shadowing on, and you almost always do, then addresses in banks \$00 and \$01 in the range \$C000-CFFF are I/O addresses. The I/O addresses are really in banks \$E0 and \$E1, but shadowing makes them accessible also in these other banks. To access the \$Cxxx addresses in RAM in those four banks, you can see them at \$Dxxx by changing the value of a monitor variable "L". Type "1=L" to see the \$Cxxx region (2nd bank of language card), or "0=L" to see the real \$Dxxx region (1st bank of language card).

That reminds me of another difference. Most of the time the //gs monitor does not care whether you type in upper or lower case. However, some commands are case sensitive. Commands which use a register name, such as the "=" command, are case sensitive. Register names MUST be in the proper case. Some registers must be in upper case, and some must be in lower case.

The disassembler in the //gs monitor handles the entire 65816 opcode set. It has all the expected trouble handling immediate mode disassembly, since there is no way the monitor can tell what mode code will be in when it is executed. You have to control the state of the disassembler's m- and x-bits yourself, by entering commands at the appropriate times. You control

SPECIAL !!! EXPANDED RAM/ROM BOARD: \$39.00

Similar to our \$30 RAM/ROM dev board described below. Except this board has two sockets to hold your choice of 2-2K RAM, 2-2K ROM or even 2-4K ROM for a total of 8K. Mix RAM and ROM too. Although Apple limits access to only 2K at a time, soft switches provide convenient socket selection. Hard switches control defaults.

IMPROVED !!! II IN A MAC (ver 2.0): \$75.00

Now includes faster graphics, UniDisk support and more! Bi-directional data transfers are a snap! This Apple II emulator runs DOS 3.3/PRODOS (including 6502 machine language routines) on a 512K MAC or MACPLUS. All Apple II features are supported such as HI/LO-RES graphics, 40/80 column text, language card and joystick. Also included: clock, RAM disk, keyboard buffer, on-screen HELP, access to the desk accessories and support for 4 logical disk drives. Includes 2 MAC diskettes (with emulation, communications and utility software, plus DOS 3.3 and PRODOS system masters, including Applesoft and Integer BASIC) and 1 Apple II diskette.

SCREEN.GEN: \$35.00

Develop HI-RES screens for the Apple II on a Macintosh. Use MACPAINT (or any other application) on the MAC to create your Apple II screen. Then use SCREEN.GEN to transfer directly from the MAC to an Apple II (with SuperSerial card) or IIC. Includes Apple II diskette with transfer software plus fully commented SOURCE code.

MIDI-MAGIC for Apple II/c: \$49.00

Compatible with any MIDI equipped music keyboard, synthesizer, organ or piano. Package includes a MIDI-out cable (plugs directly into modem port - no modifications required!) and 6-song demo diskette. Large selection of digitized QRS player-piano music available for 19.00 per diskette (write for catalog). MIDI-MAGIC compatible with Apple II family using Passport MIDI card (or our own input/output card w/drum sync for only \$99.00).

FONT DOWNLOADER & EDITOR: \$39.00

Turn your printer into a custom typesetter. Downloaded characters remain active while printer is powered. Use with any Word Processor program capable of sending ESC and control codes to printer. Switch back and forth easily between standard and custom fonts. Special functions (like expanded, compressed etc.) supported. Includes HIRES screen editor to create custom fonts and special graphics symbols. For Apple II, II+, IIx. Specify printer: Apple Imagewriter, Apple Dot Matrix, C.Itoh 8510A (Prowriter), Epson FX 80/85, or Okidata 92/192.

* **FONT LIBRARY DISKETTE #1: \$19.00** contains lots of user-contributed fonts for all printers supported by the Font Downloader & Editor. Specify printer with order.

DISASM 2.2e : \$30.00 (\$50.00 with SOURCE Code)

Use this intelligent disassembler to investigate the inner workings of Apple II machine language programs. DISASM converts machine code into meaningful, symbolic source compatible with S-C, LISA, ToolKit and other assemblers. Handles data tables, displaced object code & even provides label substitution. Address-based triple cross reference generator included. DISASM is an invaluable machine language learning aid to both novice & expert alike. Don Lancaster says DISASM is "absolutely essential" in his ASSEMBLY COOKBOOK.

The 'PERFORMER' CARD: \$39.00 (\$59.00 with SOURCE Code)

Converts a 'dumb' parallel printer I/F card into a 'smart' one. Simple command menu. Features include perforation skip, auto page numbering with date & title, large HIRES graphics & text screen dumps. Specify printer: MX-80 with Grafltrax-80, MX-100, MX-80/100 with Grafltraxplus, NEC 8092A, C.Itoh 8510 (Prowriter), Okidata 82A/83A with Okigraph & Okidata 92/93.

'MIRROR' ROM: \$25.00 (\$45.00 with SOURCE Code)

Communications ROM plugs directly into Novation's Apple-Cat Modem card. Basic modes: Dumb Terminal, Remote Console & Programmable Modem. Features include: selectable pulse or tone dialing, true dialtone detection, audible ring detect, ring-back, printer buffer, 80 col card & shift key mod support.

RAM/ROM DEVELOPMENT BOARD: \$30.00

Plugs into any Apple slot. Holds one user-supplied 2Kx8 memory chip (6116 type RAM for program development or 2716 EPROM to keep your favorite routines on-line). Maps into \$Cn00-CnFF and \$C800-CFFF.

C-PRINT For The APPLE II/c: \$69.00

Connect standard parallel printers to an Apple II/c serial port. Separate P/S included. Just plug in and print!

Unless otherwise specified, all Apple II diskettes are standard (not copy protected!) 3.3 DOS.

Avoid a \$3.00 handling charge by enclosing full payment with order. VISA/MC and COD phone orders OK.

RAK-WARE 41 Ralph Road W. Orange N.J. 07052 (201) 325-1885

their state by typing any of these four commands:

0=m 1=m 0=x 1=x

This can be pretty messy and painful, but it is one of those things we have to put up with. Of course, the monitor could be a little smarter, and TRY to follow the XCE, REP, and SEP commands, assuming that normal code will be "nice". Then we could just override when absolutely necessary. However, we have to live with what is there for now.

The disassembler now puts out a status line at the top of each set of 20 lines, which shows the state of the m- and x-bits, and the L-variable mentioned above. This is somewhat of a nuisance when using "LLLLLLL" to print out a long range, but we can live with it too. Another difference is that BRK disassembles with a one-byte value in the operand field. This has always been the correct way to handle BRK, but nobody knew it in the assembler and dis-assembler business until the 65816 came out.

The mini-assembler is also included in the //gs monitor. You get into it by using the "!" command. The prompt changes from "*" to "!". You can leave the mini-assembler and go back to the monitor by typing a RETURN key immediately after the prompt. Operation inside the mini-assembler is just like the old mini-assembler, with a few enhancements. You can assemble to any bank of RAM, specifying the bank before a slash. All of the 65816 opcodes can be assembled. You indicate 16-bit immediate by typing 3- or 4-digit values after a "#", 8-bit immediate by typing 1- or 2-digit values.

You can also enter ASCII and hex values while in the mini-assembler. Type a quotation mark followed by the characters you wish to enter in ASCII mode. Terminate the string with a RETURN. Type a colon to indicate that you are entering hex values. The number of bytes of hex data you store depends on the number of digits you type; you can type from 1 to 8 digits, occupying 1 to 4 bytes. Multi-byte values will be stored with the least significant byte first. Practice with these a while and you will get the hang of it.

Step and Trace commands are included in the //gs monitor, but they are not "plugged in". They point to vectors in bank \$E1, and all they do now is print "Step" and "Trace". The TRACE vector is at \$E1/0074, and the STEP vector is at \$E1/0078. By loading a real Step/Trace program into RAM and hooking into the vectors, you can get them to work. I have seen them work, but I do not know where to put my hands on the working code or how to load it if I had it. Do any of you?

Here are the commands, with brief commentary. (The ^ means "Control-"; "addr" may be in form "bb/aaaa" or "aaaa".)

`^B` JMP \$00E000, initial entry to Applesoft.
`^C` JMP \$00E003, re-enters Applesoft.
`Q` JMP \$0003D0, re-enters DOS or ProDOS.
`^Y` JMP \$E000A0, which normally does JMP \$0003F8.

`^E` Examine Stored Registers. Displays the contents of A X Y S D P B K M Q L m x e.
`^R` Restore Stored Registers to normal monitor mode:
 A=0000 X=0000 Y=0000 S=01FB D=0000 P=00
 B=00 K=00 M=0C Q=80 L=1 m=1 x=1 e=1
 value=reg Assign value to a stored register. The register names are case-sensitive: A X Y S D P B K M Q m x e L F. ("F" is Filter for entering ASCII, and will normally be 7F or FF.)

`s^K` Connect input hook to slot s.
`s^P` Connect output hook to slot s.

`^S` During output, pause-restart. (There appears to also be an entry at the end of the command table for ^S, but it is not really accessible due to the loop counter used.)

`^X` During memory-range display, terminate command. (This, like ^S, is not really a command.)

`^T` Similar to Applesoft TEXT command, changes screen display to text page 1.

`I` Switch to Inverse display mode.
`N` Switch to Normal display mode.

`^6c` Change cursor to new character c.
 Control-6 DELETE restores original cursor.
 Control-6 UNDERLINE is especially nice.

`addrG` Pick up stored registers and JSR addr.
 Only works properly in bank 00, because assumes user returns with RTS.

`addrX` Pick up stored registers and JSL addr.
 Assumes user returns with RTL.

`addrR` Pick up stored registers and JMP addr.

`addrL` Disassemble 20 lines starting at addr.
`L` Disassemble next 20 lines.

`addr<addr.addrM` Move the range to the target.
`addr<addr.addrV` Compare the range to the target.
`zz<addr.addrZ` Fill the range with single byte value zz.

`\pattern\<addr.addrP` Search range for pattern, which may contain hex values of 1 to 8 digits, hi-ASCII strings ("abcd"), lo-ASCII strings ('abcd'), and may be up to 236 bytes long!

`\#bytesin #bytesout parm1 ... parmN func# tool#\U`
 Call Tool (tool#) in Toolbox (func#) with parameters (parm1 ... parmN) on the stack.
 All the items between the \\ must be separated with spaces. #bytesin is total # of bytes

that will be pushed onto the stack before
calling the tool. #bytesout is the # of bytes
the tool will leave on the stack. Wow!
I dare you to try it!

addrS or S	Step, only if loaded into RAM
addrT or T	Trace, only if loaded into RAM
hexvalue=	convert hexvalue to decimal
=decvalue	convert decvalue to hexadecimal
=T	display date & time mm/dd/yy hh:mm:ss
=T=mm/dd/yy hh:mm:ss	Set date & time (both must be capital T)
addr	Display contents of addr.
addr.addr	Display contents of range.
addr:stuff	Enter information in hex or ASCII.
value+value	add
value-value	subtract
value*value	multiply
value_value	divide

EnterSoft

Basic-like macros for the S-C Macro Assembler.

Available for the Apple II, II+, IIe, and IIfx.

Uses whatever DOS your S-C Macro Assembler uses.

Soon to be released for PRODOS.

Source code included with every disk!!!

Cost? A paltry \$30.00!!!

RamFactor™

*The Highest Performance, Speed and
Software Compatibility of Any Slot 1-7 Memory Card
for the Apple II+, IIe or IIGs.*

Now anyone with an Apple II+, Franklin, Laser 128, Apple IIe or IIGs preferring to use slots 1 through 7 can now enjoy the speed and performance that they've been waiting for.

With RamFactor, you'll be able to instantly add another 256K, 512K, or a full 1 MEG on the main board and up to 16 MEG with additional piggyback card. And since virtually all software is automatically compatible with RamFactor, you'll immediately be able to load programs into RamFactor for instantaneous access to information. You'll also be able to store more data for larger word processing documents, bigger data bases, and expanded spreadsheets. And with the battery back-up option you can switch on your Apple and any of your favorite software will be up and running in less than 1 second!

Very Compatible

All the leading software is already compatible with RamFactor. Programs like AppleWorks, Pinpoint, BPI, Managing Your Money, Dollars and Sense, SuperCalc 3A, PFS, MouseWrite, MouseDesk, MouseCalc, Sensible Speller, Applewriter IIe, Business Works, ReportWorks, Catalyst 3.0 and more. And RamFactor is fully ProDos, DOS 3.3, Pascal 1.3 and CP/M compatible. In fact, no other slot 1-7 memory card is more compatible with commercial software.

AppleWorks Power

There are other slot 1-7 cards that give AppleWorks a larger desktop, but that's the end of their story. But RamFactor is the only slot 1-7 card that increases AppleWorks internal memory limits, increasing the maximum number of records in the database and lines permitted in the word processor, and RamFactor is the only standard slot card that will automatically load all of AppleWorks into RAM dramatically increasing speed and eliminating the time required to access the program disk, it will even display the time and date on the AppleWorks screen with any ProDos clock. RamFactor will automatically segment large files so they can be saved on 5¼", 3½", and hard disks. All this performance is available to anyone with an

Apple IIe, IIGs or II+ with an 80 column card. RamFactor, no other standard slot card comes close to enhancing AppleWorks so much.

True 65C816 16 Bit Power

RamFactor has a built-in 65C816 CPU port for direct connection to our IIe 65C816 card for linearly addressing up to 16 MEG for the most powerful 16 bit applications. (II+ 65C816 card under development.)

Powerful Program Switcher

With RamFactor, you can organize memory into multiple work areas and switch between them. Each work area can contain different programs and even different operating systems. Now you can switch from one program to another or even switch from AppleWorks to DOS 3.3 to CP/M to Pascal to ProDos in under a second. And with our Battery back-up option, you can have permanent storage for up to 20 years.

Quality and Support of the Industry Leader

RamFactor is from Applied Engineering, the largest, most well supported manufacturer of Apple peripherals and the inventor of large RAM cards for the Apple. With our 5 year no hassle warranty and outstanding technical support, you're assured of the most trouble free product you can buy.

Features:

- Up to 16 MEG total memory; 256K to 1 MEG on main board. Up to 16 MEG with additional memory on piggyback card.
- Fully Apple II Memory Expansion compatible
- Compatible with Apple IIe, II+, IIGs, Franklin and Laser 128
- Battery back-up option allows you to turn on your Apple and run your favorite programs in less than 1 second!
- Automatically recognized by ProDos, DOS 3.3, Pascal and standard CP/M
- Built-in RamDrive™ software (a true RAM disk not disk caching)
- Systems are directly bootable from RamFactor if desired
- Built-in linear addressing 16 bit co-processor port
- Built-in self diagnostic software
- Automatic expansion with AppleWorks 1.3 or later
- Allows Apple II+ and IIe to run your AppleWorks without buying additional software
- Accelerates AppleWorks
- Displays time and date on the AppleWorks screen with any ProDos clock
- Fits any I/O slot except slot 3
- Fully socketed and user upgradeable
- Much, much more

New ProDOS Version of S-C XREF.....Bob Sander-Cederlof

An upgrade is now available for the ProDOS version of the S-C XREF program. XREF stands for Cross Reference, and if you are working on large programs with the S-C Macro Assembler you really need it. If you already have it, and are developing programs under ProDOS, you will enjoy this new upgrade.

The new version still fits in the same space, loading between \$800 and \$FFF. (It is actually a little shorter than the previous release.) There are, however, a lot of new features.

First and foremost, I added the ability to automatically handle a source program which uses the .IN or .INB directive for multiple source files. The previous release required you to create a complex EXEC file to control XREF if you wanted to make a complete cross reference for a program that was spread over several files. Sometimes a lot of juggling was required. For example, when I run XREF on the source code of the S-C Macro Assembler (which consists of over two dozen files on two floppies), I had to make two passes: one pass for symbols beginning with A-L, another for symbols starting with M-Z. The EXEC file for each consisted of over 50 lines. Too much!

Anyway, with the new version I can simply LOAD the main assembly control file (the source file containing the .IN directives) and type "-XREF". The new version automatically letters each included file for purposes of identifying where each cross reference came from. The main file, which contains the .IN directives, is identified by not having a letter. In other words, its identifier is a blank. The first 26 included files are lettered A-Z; the next 26 are lettered a-z; the next 10 are numbered 0-9; if you have another, it gets a punctuation symbol (:). Sixty-four files should be enough!

One reason I have so many separate source files for one program is so that I could squeeze out a meaningful cross reference. With this new version the file size is not so important. During operation, when XREF sees an include directive (either .IN or .INB), only 512 bytes are needed for reading the file. It is read in only one block at a time, equivalent to the normal .INB or .INB1. This leaves a lot more room for symbols.

The new version also prints a legend of the included files, showing the assigned letter or number and the file name for each. This makes it a lot easier to read the printed cross reference listing.

I simplified the syntax analysis portion of XREF, so that tables particularizing it to the opcodes of a single micro-processor are no longer necessary. This means that the same XREF program can operate on the source code of any of our assemblers. Not only 6502, 65C02, and 65816 code, but also 6800, 6805, etc. Now if we could just upgrade all the rest of our cross assemblers to run under ProDOS.... The purpose (in the previous version) for opcode tables was to inform XREF of which opcodes had no operands, and which if any had the option to be used both with and without operands. This is no longer

Viewmaster 80

Now run AppleWorks™ on your II+ *and* keep full 80 column compatibility!

	800K RAM OPTION	800K RAM OPTION	LOW POWER OPTION	80 COLUMN MODE	7.5 Mhz MODE	LOCAL PRINTS	80 COLUMN OPTION	INTER- CHARACTER
VIEWMASTER 80	x	x	x	x	x	x	x	x
SMARTTERM		x				x	x	
WIZARD 80						x	x	
VISION 80	x	x					x	
OMNIVISION		x				x	x	
VIEWMAX 80		x		x			x	
SMARTERM	x	x			x	x	x	
VIDEOTERM		x	x		x		x	x

One look at the chart will give you some of the reasons there's only one smart choice in 80 column cards for your Apple. But the real secret to Viewmaster 80's success is something even better: Total compatibility.

Each Viewmaster 80 includes our powerful AppleWorks expand software, allowing AppleWorks to run on the II+ with only 64K (or more) memory. (We recommend the RamFactor memory card, but any compatible Apple memory card will work.) The software provides our full range of AppleWorks enhancements, including expanded records, word processor, multi-disk saving, time and date display on screen with any PRO-DOS clock, and more!

The Viewmaster 80 works with all 80 column applications, including DOS 3.3, PRO-DOS, CP/M, Pascal, WordStar, Format II, Applewriter II, dBase II, Visicalc, Multiplan, and *hundreds* of others — including AppleWorks.

Here are just a few of the powerful features the Viewmaster 80 delivers for a great price (\$149):

- 80 Characters by 24 lines • Fully compatible with all Apple languages and software • Highest compatibility with existing 80 column software • Very low power consumption • High speed (18 MHZ) scroll rate • Upper and lower case characters and true descenders, both inverse and normal; all on-screen editing functions are supported • User-definable cursor shape • Compatible with Apple II, II+ and IIe • Five-year warranty

Call today to order or for more information, 9 a.m. to 11 p.m. seven days, or send check or money order to Applied Engineering, MasterCard, VISA and C.O.D. welcome. Texas residents add 5½% sales tax. Add \$10.00 outside U.S.A.

To boldly go at speeds no man has gone before.

*With the TransWarp™ accelerator, your IIe™ or II+™
is 40% faster than the IIGs!*

Computing at warp speed!

It's an experience you shouldn't miss. And with TransWarp, you won't have to. Because TransWarp will run your IIe or II+ software 3.6 times faster—that's 40% faster than Apple's IIgs!

No more yawning while your Apple™ slowly rearranges text or calculates spreadsheets. With 256K of ultra-fast RAM, TransWarp speeds up *all* Apple software—including Apple Works, and all educational software, graphics and games. And it's compatible with all standard peripheral cards (such as Ram Works and Apple memory cards), hard disks, 3 1/2" Unidisks, 80-column cards, modems, clock cards, mice and more! You name it, TransWarp accelerates it. There's even a 16 bit upgrade chip available.

"TransWarp is great! I have replaced all my other accelerators with it!"

*Steve Wozniak, the creator
of Apple Computer*

An important difference.

With TransWarp, software runs up to three times faster than with other cards, since the others can't accelerate programs in auxiliary memory. That's why TransWarp is so much faster than the rest. Nearly all of today's more powerful programs run partially or completely in auxiliary memory: programs like Apple Works, Pinpoint, Managing Your Money, SuperCalc, 5x, BPT and Pascal, to name a few. Why settle for a card that accelerates only part of the memory?

There's one more important difference. Since TransWarp doesn't use memory caching, you get *consistent* high-speed performance.

A cinch to use.

Simply plug TransWarp into any slot in your Apple IIe, II+ or IIc—including slot 3 in the IIc. Instantly you'll be computing

at speeds you only dreamed about before. And should you ever wish to run at normal speed, simply press the ESC key while turning your Apple on.

Since TransWarp is completely transparent, you won't need preboot disks or special software. It's ready to go right out of the package!

Speed = Productivity

Imagine the productivity gains you'll achieve when your programs are running over three times faster. TransWarp is so powerful, your Apple will make IBM PCs™ and even ATs™ look like slowpokes.

- 3.6 MHz 65C02
- 256K of ultra-fast on-board RAM
- Accelerates main and auxiliary memory
- Low power consumption for cool operation
- Totally transparent operation with all software
- Plugs into any slot, including slot 3 on the Apple IIc
- Accelerated 16 bit option available
- 5 year warranty

Satisfaction guaranteed!

Give your Apple the TransWarp advantage. With our risk free 15-day money back guarantee, you have nothing to lose but wasted time. Call today!

TransWarp accelerator	\$279
16 bit upgrade (may add later)	\$89

Call Applied Engineering 9 a.m. to 11 p.m., 7 days at (214) 241-6060. MasterCard, VISA and C.O.D. welcome. Texas residents add 5% sales tax. Add \$10.00 if outside U.S.A. Or mail check or money order to Applied Engineering, P.O. Box 798, Carrollton, TX 75006.

AE Applied Engineering
The Apple enhancement experts.

P.O. Box 798, Carrollton, TX 75006 (214) 241-6060

necessary. Instead, I use a single user-set parameter to indicate how many spaces to allow after an opcode before believing the comment field has been reached. The default for this parameter is two, which works well with the 6502 family. Some other microprocessors, which have opcode names of varying length, might require a higher value. I also added code to terminate the operand scan when a semi-colon is encountered.

Another new user-set parameter allows the user to choose to ignore the ,X and ,Y indexing in the cross reference listing. I personally found no benefit to seeing those two large entries, since X and Y were not really symbol names. The default position for this parameter avoids listing references to X and Y if they are only referenced and never defined within the program. If you liked it the old way, simply change the parameter setting.

I added a third entry point. The first one, at \$800, starts with a fresh slate and does a cross reference for the program in memory. \$803 continues a cross reference, without erasing the symbols already gathered. The new one, at \$806, lists the cross reference that is already in the symbol table. I find this useful when I need a second copy and do not wish to wait for all the files to be processed over again.

I fixed some problems in the processing of the .TI directive, so that titles now appear properly on the cross reference listing. Of course, if you have more than one .TI directive in your source code, the entire cross reference listing will use the last one.

There are more improvements, but this is enough detail for this article. If you already own the S-C XREF, you can get the upgraded ProDOS version for \$10. If you purchased the source code with your XREF, we will include the new source code too. If you do not have S-C XREF yet, the price is \$50 including source code, with the DOS version on one side and the new ProDOS version on the other.

If you have been thinking about typing in the sample programs from Beneath Apple ProDOS, but just haven't gotten around to it yet, there is an easy way out. Pete Johnson has done all the hard part for you. He typed them in and got them running, after a lot of head-scratching. If you send him \$2 and a blank diskette, he will send you a copy. The source files are in the S-C Macro Assembler format, and he includes the binary object files also. The programs are ZAP, FORMAT, TYPE, FIB, and DUMP. He does not include MAP (which is in Basic) and DUMBTerm. Pete's address is P. O. Box 5, New London, Minnesota 56273.

Apple Assembly Line (ISSN 0889-4302) is published monthly by S-C SOFTWARE CORPORATION, P.O. Box 280300, Dallas, Texas 75228. Phone (214) 324-2050.
